HORSE LEG MARKINGS

When writing descriptions for EIA test charts, or any other forms which require a description of markings, it is good to use a standard measure for markings. Keep in mind that many animals also exhibit dark spots among the white markings, but that does not change the name of the marking. Below is a quick reference guide to leg markings.

CORONET. A coronet marking is white along the coronary band. It may also be listed as a partial coronet with the white only being along a small section of the coronary band. This marking often times will have dark spots in it. Photo exhibits full coronet marking.

PASTERN. A pastern marking is white that covers the pastern area of a leg. This may slightly extend up into the ankle area too. Frequently this marking may only be a "partial" in that only a section of the pastern will have white, yet another area will have the base coat or point color along the hairline. This is listed as a partial pastern. This marking may too have dark spots within. Photo exhibits full pastern with extension slightly up into the back of the ankle joint.

ANKLET. The anklet marking is white that starts in and around the ankle joint. This marking may also contain dark spots within.

SOCK. A sock extends slightly above the ankle joint as high up as midway up the cannon bone.

STOCKING. A stocking is a white marking that extends at a minimum of $\frac{3}{4}$ of the way up the cannon bone (taller than a sock) and may extend into the knee/hock joints. The stocking may even extend above the same joint.
